248 issues with uncached JavaScript and CSS files **About this issue:** This issue is triggered if browser caching is not specified in the response header. Enabling browser caching for JavaScript and CSS files allows browsers to store and reuse these resources without having to download them again when requesting your page. That way the browser will download less data, which will decrease your page load time. And the less time it takes to load your page, the happier your visitors are. For more information, please see this Google article. **How to fix:** If JavaScript and CSS files are hosted on your website, enable browser caching for them. If JavaScript and CSS files are hosted on a website that you don't own, contact the website owner and ask them to enable browser caching for them. If this issue doesn't affect your page load time, simply ignore it.	248 ↑34
20 pages have low text-HTML ratio **About this issue:** Your text to HTML ratio indicates the amount of actual text you have on your webpage compared to the amount of code. This issue is triggered when your text to HTML is 10% or less. Search engines have begun focusing on pages that contain more content. That's why a higher text to HTML ratio means your page has a better chance of getting a good position in search results. Less code increases your page's load speed and also helps your rankings. It also helps search engine robots crawl your website faster. **How to fix:** Split your webpage's text content and code into separate files and compare their size. If the size of your code file exceeds the size of the text file, review your page's HTML code and consider optimizing its structure and removing embedded scripts and styles.	20 ↑4

Warnings	Amount
8 pages have a low word count **About this issue:** This issue is triggered if the number of words on your webpage is less than 200. The amount of text placed on your webpage is a quality signal to search engines. Search engines prefer to provide as much information to users as possible, so pages with longer content tend to be placed higher in search results, as opposed to those with lower word counts. For more information, please view this video **How to fix:** Improve your on-page content and be sure to include more than 200 meaningful words.	8 ↓1
5 pages don't have an h1 heading **About this issue:** While less important than <title> tags, h1 headings still help define your page's topic for search engines and users. If an <h1> tag is empty or missing, search engines may place your page lower than they would otherwise. Besides, a lack of an <h1> tag breaks your page's heading hierarchy, which is not SEO friendly. **How to fix:** Provide a concise, relevant h1 heading for each of your page.	5 0
0 external links are broken	0 0
0 external images are broken	0 0
0 links on HTTPS pages lead to HTTP page	0 0
0 pages don't have enough text within the title tags	0 0
0 pages have too much text within the title tags	0 0

4 orphaned pages in Google Analytics **About this issue:** A webpage that is not linked to internally is called an orphaned page. It is very important to check your website for such pages. If a page has valuable content but is not linked to by another page on your website, it can miss out on the opportunity to receive enough link juice. Orphaned pages that no longer serve their purpose confuse your users and, as a result, negatively affect their experience. We identify orphaned pages on your website by comparing the number of pages we crawled to the number of pages in your Google Analytics account. That's why to check your website for any orphaned pages, you need to connect your Google Analytics account. **How to fix:** Review all orphaned pages on your website and do either of the following: - If a page is no longer needed, remove it - If a page has valuable content and brings traffic to your website, link to it from another page on your website - If a page serves a specific need and requires no internal linking, leave it as is	4 0
2 subdomains don't support HSTS **About this issue:** HTTP Strict Transport Security (HSTS) informs web browsers that they can communicate with servers only through HTTPS connections. So, to ensure that you don't serve unsecured content to your audience, we recommend that you implement HSTS support. **How to fix:** Use a server that supports HSTS.	2 0
1 page is blocked from crawling **About this issue:** If a page cannot be accessed by search engines, it will never appear in search results. A page can be blocked from crawling either by a robots.txt file or a noindex meta tag. **How to fix:** Make sure that pages with valuable content are not blocked from crawling by mistake.	1 0

Notices	Amount
1 link has non-descriptive anchor text **About this issue:** The issue is triggered if the anchor text for a link (internal or external) is non-descriptive. An anchor is considered to be non-descriptive if it doesn't say what the page is about (click here, right here, etc.). This issue makes it difficult for the target page to be indexed by search engines and rank for relevant search requests. Learn more **How to fix:** To let users and search engines understand the meaning of the linked-to page, use succinct anchor text that describes the page's content. Learn more	1 0
0 pages have more than one H1 tag	0 0
Llms.txt not found	0 0
0 page URLs are longer than 200 characters	0 0
